

Bacitracin vials

Bacitracin is comprised of a polypeptide complex and bacitracin A is the major component in this complex active against a variety of Gram-positive bacteria and a few Gram-negative bacteria, however only staphylococcal infections qualify for the systemic therapy.

Indication: The use of intramuscular bacitracin is limited to the treatment of infants with pneumonia and empyema caused by staphylococci shown to be susceptible to the drug.

Application: Administered systemically as intramuscular injections.

Dosage form	Lyophilized vials
Strength	50000 units/vial
